What should I know about COVID-19 and COVID-19 vaccines if I want to have a baby one day?

Catching COVID-19 can be dangerous for you and your future family.

COVID-19 vaccines are safe for people who want to get pregnant. They are also safe for their partners.

No data shows that COVID-19 vaccines make it harder to have a baby.

⚠️ Summing up the Science

On Pregnancy After COVID-19 Vaccination
A recent study compared pregnancy success rates among three groups of people:
- People who were trying to get pregnant and had antibodies trained by the COVID-19 vaccine
- Antibodies triggered by COVID-19 infection
- No antibodies against COVID-19

The study found no major contrasts between these groups. COVID-19 vaccines did not change their chances of getting pregnant.

On Sperm Behavior After COVID-19 Vaccination
A recent small study tested the sperm of people who had received an mRNA COVID-19 vaccine. Their sperm acted no differently than those who did not receive a vaccine. They also had about the same number of sperm. The vaccine didn't impact their ability to get someone pregnant.

Americares is a health-focused relief and development organization that responds to people affected by poverty or disaster with life-changing health programs, medicine, medical supplies and emergency aid.
You can still get pregnant after receiving a COVID-19 vaccine.

The vaccine helps your body produce antibodies. These antibodies do not affect your ability to get pregnant.

The ingredients in the vaccines are also safe. They have not been shown to impact fertility either.

You can still get someone else pregnant after receiving a COVID-19 vaccine.

There is no evidence that COVID-19 vaccines hurt your chances of getting someone else pregnant. Experts agree that people who are trying to get their partner pregnant should get a COVID-19 vaccine.

Fever from illness has been tied to a short-term decrease in sperm. Although fever can be a side effect of a COVID-19 vaccine, no research has shown that this short-term fever affects sperm counts.

Catching COVID-19 can be dangerous if you have not gotten a COVID-19 vaccine.

- More Than -

97% of people who go to the hospital for COVID-19 have not taken a vaccine.

99% of people who die from COVID-19 are not vaccinated.

You can protect yourself, your loved ones, and your future family by getting a COVID-19 vaccine.

Plan to get your COVID-19 vaccine at www.vaccines.gov.
