The CDC issued an advisory for the potential of “COVID-19 rebound” after the completion of a Paxlovid course. COVID-19 rebound has been reported to occur between 2-8 days after initial recovery. It’s characterized by a recurrence of COVID-19 symptoms or a new positive viral test after having tested negative. A brief return of symptoms may be part of the natural history of the virus in some people. There is currently no evidence that additional treatment for COVID-19 is needed for COVID-19 rebound.
